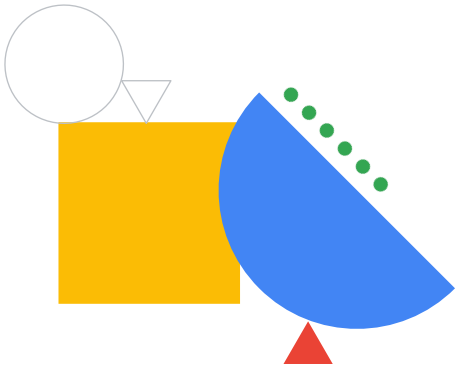
Google Cloud

Logging and Monitoring in Google Cloud



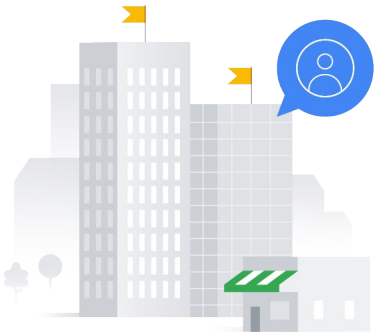
Introduction

Welcome to the two-part course on Logging, Monitoring, and Observability in Google Cloud. The core operations tools in Google Cloud break down into two major categories. The operations-focused components and the application performance management tools. The first course is Logging and Monitoring in Google Cloud, which is this course, and covers the operations-focused components including Logging, Monitoring, and Service Monitoring. This course tends to be more for personnel who are primarily interested in infrastructure, and keeping that infrastructure up, running, and error-free.

The second course is Observability in Google Cloud, which covers the application performance management tools, including Error Reporting, Trace, and Profiler. This course in contrast, tends to be more for developers who are trying to perfect or troubleshoot applications that are running in one of the Google Cloud compute products.

But it isn't fair to think of these tools as belonging purely to either of these two groups. A developer would, of course, sometimes need access to logs or monitoring metrics, just like an operation team member might need to trace latency.

Target audience

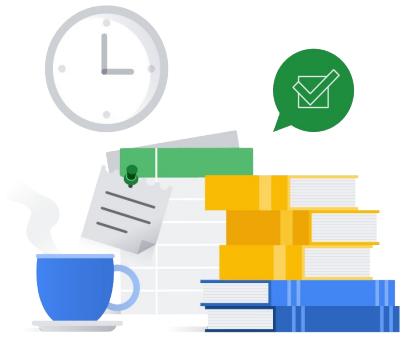


- Cloud architects, administrators, and SysOps personnel
- Cloud developers and DevOps personnel

Google Cloud

This course is designed to equip Cloud Architects, Administrators, SysOps personnel, Cloud Developers, and DevOps personnel with the essential skills and knowledge needed to excel in logging and monitoring your applications and workloads on Google Cloud.

Prerequisites



- Google Cloud Fundamentals: Core Infrastructure or equivalent experience
- Basic scripting or coding
- Proficiency with command-line tools and Linux operating system environments

The prerequisites for this course are:

- Basic scripting or coding ability,
- Google Cloud Fundamentals: Core Infrastructure or equivalent experience,
- a.nd proficiency with command-line tools and Linux operating system environments.

Objectives

01 Explain the purpose and capabilities of Google Cloud Observability

02 Implement monitoring for multiple cloud projects

03 Create alerting policies, uptime checks and alerts

04 Collect, analyse and export logging data

In this course, we will delve into the critical aspects of Cloud Logging and Cloud Monitoring on Google Cloud. Logging and monitoring play a pivotal role in maintaining the health and security of your cloud resources. You will learn:

- The purpose and capabilities of Google Cloud Observability,
- How to Implement monitoring for multiple cloud projects,
- Create alerting policies, uptime checks and alerts to identify and resolve problems quickly,
- And collect, analyse and export logging data.

By the end of this course, you will have a solid grasp of how to implement and manage cloud logging and monitoring solutions within Google Cloud, enhancing your skills to maintain the reliability and security of your infrastructure.

Let's get started!
