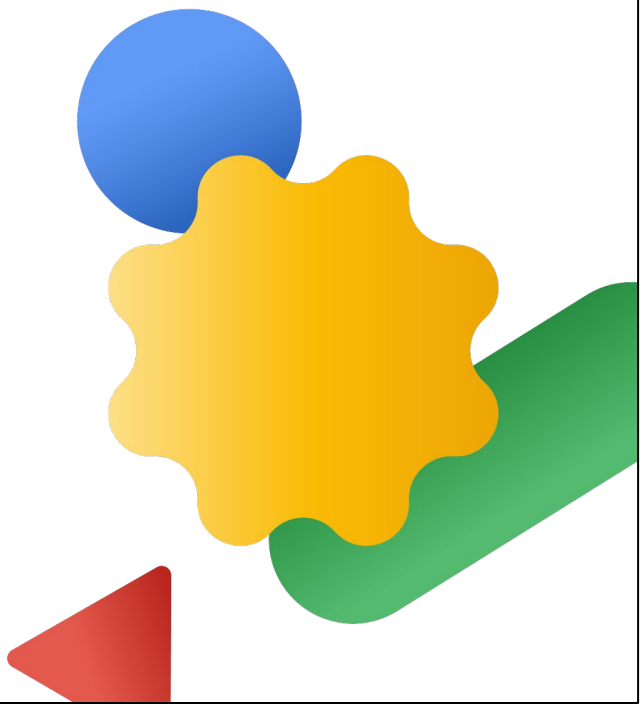
Google Cloud

Review: Service identity and authentication



Let’s review the topics that were discussed in this module.

Proprietary + Confidential

In this module, you learned about:

01	Service account and identity
02	Resource hierarchy
03	Principle of least privilege
04	Secrets and environment variables

Google Cloud

In this module, we discussed what is a service account and how you can provide your Cloud Run service with its own identity, by creating and setting a user-managed service account. We discussed the role of the service account when accessing Google Cloud APIs and how they can be used for service to service communication.

We reviewed how resources in Google Cloud are organized hierarchically. You learned about policy bindings, how they are inherited by resources from their parents, and how they are used to allow or deny access to resources.

We also discussed the principle of least privilege that should be followed when granting roles and permissions to members including service accounts.

Finally, we discussed how you can provide your Cloud Run service or job access to environment variables and secrets.
